

**Ref: Anti-Terrorism Device for Airplanes  
Congressional Committee visit to AAE:**

Program Director of Transportation Security, Ms Robin Hunt have sent a team from the Office of Inspector General to visit our offices and review our device. Additionally, the team's report has been sent to Congressman Martin Sabo, Ranking Member of the Subcommittee on Transportation, at his request.

Since the team has told us that our device is good, we ask you to follow up with Hon. Mineta's office.

**How the device Works;** As the plane descends and heads toward a target, the Hi-Tech Passive Sensor recognizes danger, within 2-6 seconds the plane is automatically diverted from danger. The device turns itself OFF to let pilot regain control, and the device alerts the FAA, CIA, FBI, & Airline Head Quarters

**Homeland Defense;** In addition to 6,000 passenger's jet planes in the USA, there are also 380,000 small planes. A Cessna with 40 Lbs of C4 explosive crashed into NYC Atomic Reactor, will cause mass killing and destruction and makes New York City un-inhabitable for 20 years.

**Cost of the Device:** The sensor, cell phone, and embedded PC chip in hidden 3"x3"x1" metal box is \$995..

**Demonstration:** We have an airplane fitted with the device for demonstration.

**Contact:** Mr. Martin Chekel, President,  
AAE, 1738 Tradewinds Lane,
